

An advanced composites molder switched from a solvent release to 9825 water-based release.

A long-time solvent-based customer agreed to evaluate **TraSys® 9825** to determine how a water-based release would perform at high temperatures with their resin system. Over and above the environmental and safety advantages of water-based systems, they found significantly less build-up on the tool surface. Any residue just simply wiped off. Previously with solvent-based, they would have to scrape it off. This resulted in more molding cycles between tool cleaning and better finished parts.

Item # 9825

This molder switched to TraSys® 9825 because:

- Improved efficiency - less build-up on mold.
- Improved part appearance and enhanced details.
- Non flammable
- No odor - zero VOC.

TraSys® 9825 is a versatile, high performance release agent for polyester, vinyl ester, epoxy, phenolic, rubber and fluoropolymers. Perfect for applications such as compression molding, filament winding, vacuum bag, autoclave and injection molding.
